

How CiPot Database Work:

1. CRUD with website based, so teacher can update their student progress in batch at their lovely PC
2. Daily report can be seen by parents using android app, once they pulled out the phone you'll know what your kids are doing
3. Database store many items in detail including report, login credential, CRUD Log.
4. Report is stored with x tables, one of each tables stored y competencies.
5. Report also provide 'semester' data that accumulate the six months of learning
6. Database also stored login credential for admin, teacher and parents.
7. Parents and teacher can be communicate with feedbacking system so there's no boundaries even the parents are far away at hongkong or hawaii.

Issue:

1. We still don't know how to communicate with firebase through PHP based framework (for teacher CRUD), is that possible?
2. Having some issues to determine what table configuration we should use, we don't know how the data gonna be stored. (our programmer do)
